Tables

Bootstrap Tables

- Many people use Bootstrap styling for the tables.

- This is an example of using many classes on a single element.

- The table class is the foundation

Classes

- .table: some padding and horizontal dividers
- .table-striped: zebra stripes where "odd" rows have light color
- .table-bordered: add borders to table and cells
- .table-hover: adds hover state styling

Responsive tables

- There is only one breakpoint for responsive tables

- Default (under 768px) allows horizontal scrolling

- Larger screens are just the default view

Row, header, and cell classes

- It is possible to use Bootstrap to style smaller elements

    - active, success, info

    - warning, danger

- Since these are classes, not tags they are not semantic

Examples

RD: Bootstrap Tables

Should you use them?

- The Bootstrap styles for tables are very nuanced.

- If you want style with more impact you can write your own rules or overwrite some elements of the Bootstrap styles.
